SUMMARY

An accomplished leader with over 25 years of proven experience in building cloud infrastructure, compute, database, and storage technologies to drive a simplified user experience at scale. Creates and fosters an environment that leads to a highly engaged and productive engineering workforce that lives the value of non-stop service. Manages diverse global teams by hiring and mentoring adept leaders and principal engineers to meet customer-obsessed and highly available cloud services.

COMPETENCIES

Cloud Infrastructure	AWS Aurora MySQL	Databases & File systems	DevOps & Pipelines
Operations Excellence	Simplicity/UI	Upgrades & Availability	SRE Management
Compute Serverless	Strategic Planning	Parallel Query & Exports	Aurora Streams

EXPERIENCE

Head of Engineering, Aurora MySQL, Amazon Web Services, Dec 2021 - Current

- Delivered AWS Aurora Serverless service for the seamless fine-grained scale-up/down compute to meet the dynamic DB workloads with the sleep and resume mechanism
- Enabled team to deliver in-place migration service from ASv1 (Aurora Serverless V1) to ASv2
- Managed Aurora FastRestart feature delivery to reduce Aurora MySQL engine restart times by 24 times from 120 to 5 seconds for P99 customer workloads
- Delivered Parallel Export feature with 100x speed by leveraging Parallel Query architecture to seed the Aurora DB for the Redshift ZeroETL service enablement followed by Aurora streams for the automated incremental data stream paradigm.
- Executed and delivered a Zero Downtime (ZD) mechanism for the seamless upgrade in less than 10 seconds for millions of AWS Aurora Database compute servers at P99 measurement
- Delivered Transactional Minor Version Upgrade (txmvu) feature and workflows to automated recovery for the incompatible community MySQL version upgrade failures
- Automated Community MySQL to Aurora MySQL code merge integration to maintain the currency compatibility for the database security, durability, and availability features
- Conserved \$6M per annum in immediate infrastructure CapEX with the automated canary optimizations driven by E2E service telemetry and observability
- Established AI/ML (Minions) infrastructure across the global regions to automate the sev2 incident alarms and resolution to reduce 56% of the Aurora MySQL operations burden
- Maintained operational excellence by implementing regular COE (correction of errors)
- Established a team to deliver the Aurora MySQL limitless database beta-solution through the multi-shard and multi-router scale-out architecture

Senior Director, HCI (Hyper Converged Infrastructure) Eng, NetApp, Inc, Apr 2016- Nov 2021

- Headed HCC (Hybrid Cloud Control) solution to manage simplified scale-out deployments, automated upgrades, continuous security updates, and support bundle collections.

- Enabled and executed customer strategy for Hybrid Cloud Migrations from Private to Public Cloud using Cloud Volume ONTAP(CVO) as Storage as a Service (SaaS) through Data Fabric
- Built an AWS-based SaaS data log streaming service for the Active IQ platform for the telemetry data, enterprise customer incidents, analytics, and dashboards to serve 8K+ HCI cluster deployments
- Guided SRE Ops in supporting Infrastructure products such as Hyper Converged Infrastructure (HCI), Cloud Volume Services (CVS) at Azure and GCP, and Cloud ONTAP (SaaS) at AWS
- Integrated vSphere 7.0 support into the HCI manageability portfolio and conducted performance benchmarks to meet customer scale-out requirements
- Avoided 80% of cluster faults and performance hotspots by predicting storage failures based on SMART telemetry analytics through bin-syncing feature in the HCI distributed architecture
- Operated \$2B revenue portfolio for ONTAP maintenance delivery through the product life cycle by managing financial budgets to a predefined operating model and P&L support
- Reduced 90% of regressions in the field with left-shift automated suites QA paradigm through continuous integration and delivery (CI/CDs)
- Established incident command control, quality deliverables, lessons learn plan (LLP) culture to achieve 5-9's availability for cloud operations through improved reliability and simplicity
- Automated cloud service incidents and provisioning alerts to drive operational excellence while improving reliability and resiliency for 5-9's availability

Director, Continuous Product Engineering, NetApp, Inc, Jan 2001- Apr 2016 (multiple positions)

- Introduced resiliency checksum feature into ONTAP file systems to identify and prevent enterprise customer Data Unavailability (DU) and Data Loss (DL) incidents.
- Accelerated \$100M additional revenue by establishing Dedupe and Compression capacity calculator to validate and show clients the improved data compression ROI while maintaining performance.
- Built a team to deliver AIQ PAS (Performance Analytics Service) to provide Grafana-based operational analytics to the customers while enabling support to conduct quick diagnosis
- Automated performance signatures (ML) to drive field case analysis to improve CSAT and reduce 30% operational cost of customer performance incidents
- Influenced cross-functional organizations to build a predictable half-yearly Release Model with the focus on Customer First principles to meet the enterprise customer maintenance window
- Engineered incident-based analytics (Machine Learning) for auto-routing of technical cases directly into L2 vs L1 support to improve 30% of CSAT and saved \$2M per annum
- Delivered automated HA Cluster takeover and giveback features to improve availability of the enterprise solutions to 5-9's in the field and reduced 60% P1 disruption incidents

EDUCATION

Master of Science, Electrical & Computer Engineering

Bachelor of Science, Electrical & Electronics Engineering
